PUNCH

Proof of presence. Paid honestly.

92 %
to the person who showed up

3 %
to SKR holders

5 %
to the app

Built for CLOCK IN · Solana Mobile · devnet demo
github.com/Azumizeus/punch-clockin

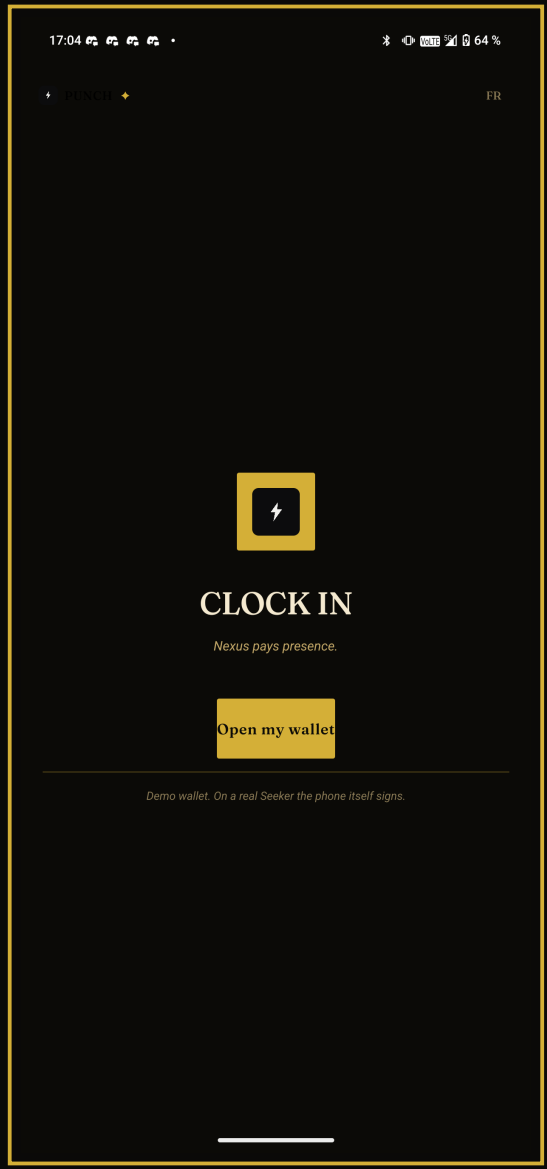

Presence apps on crypto are fake in one of two ways

- The check-in isn't verified — anyone can fake it from a browser.
- Or the money split is hidden behind a token model nobody can audit.

Gig workers and communities have no honest way to turn “I was here” into income.

One tap a day on a real Seeker proves you're here — and pays you

- A real signed Solana transaction proves your presence — the phone signs, the explorer proves.
- It unlocks small paid gigs nearby: confirm a place is open, leave an honest review, scan a code.

Every payment follows one printed rule: 92% worker · 3% SKR holders · 5% app.
Visible on every receipt. Never hidden.

Everything is a real transaction, from punch in to cash out

- Punch in — memo transaction signed in Seed Vault, confirmed on devnet in seconds.
- Ticket — paper-style receipt: time, country, 92/3/5, on-chain stamp (clickable signature).
- Gigs — confirm a place is open, review it honestly, scan a code. Paid in USDC/USDT.
- Post a job — lock real funds from your wallet; the treasury pays the worker.

Staking SKR unlocks better-paid jobs — real utility, zero new supply

- Stake SKR to climb the ranks (Silver 1,000 · Gold 5,000 · Guardian 25,000) and reach gigs first.
- Swap USDC/USDT/SKR at a fixed rate; unstake carries an honest 1.5% protocol fee.
- Protocol fees fund the protocol and buy back SKR for holders.

This is our CLOCK IN SKR-integration entry.

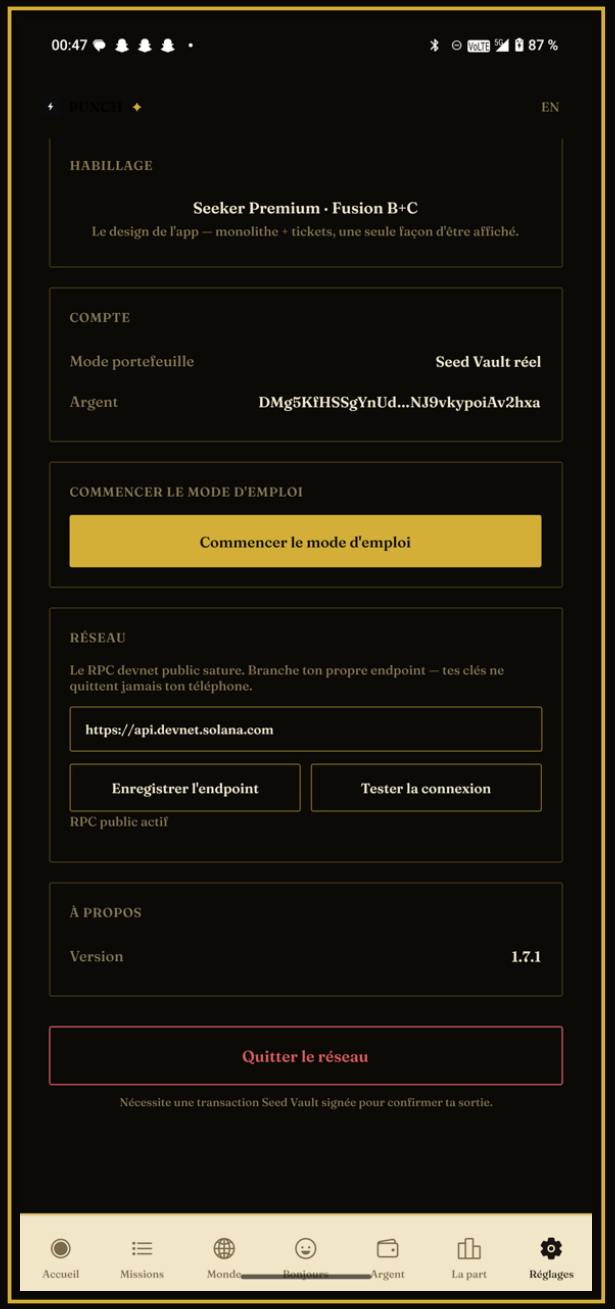

Nothing is simulated.
Every cent is a signed devnet transaction.

- Punch in, get paid, swap, stake, say-hi, leave the network — all real, all through Mobile Wallet Adapter / Seed Vault.
- The treasury is public: watch balances move on the explorer while you use the app.
- No fake numbers in local storage. Anywhere.

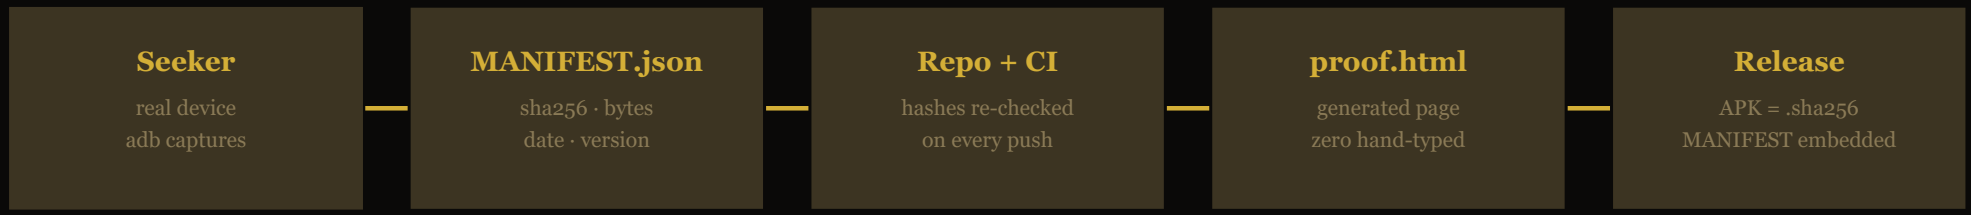

Treasury: FUiCbnDhEEJtz9Zcj66hGB54iGMGeyjRKD7CsTwpihJn

The Settings screen proves it: public RPC, version 1.7.1, honest exit

- Network section: custom RPC endpoint with a live “Test connection” check — “RPC public actif” when the endpoint answers.
- A wrong endpoint fails honestly: the exact reason is shown, nothing moves, nothing is signed.
- About: Version 1.7.1 — and “Quitter le réseau” requires a real signed Seed Vault transaction.

Everything you see online is what the phone produced

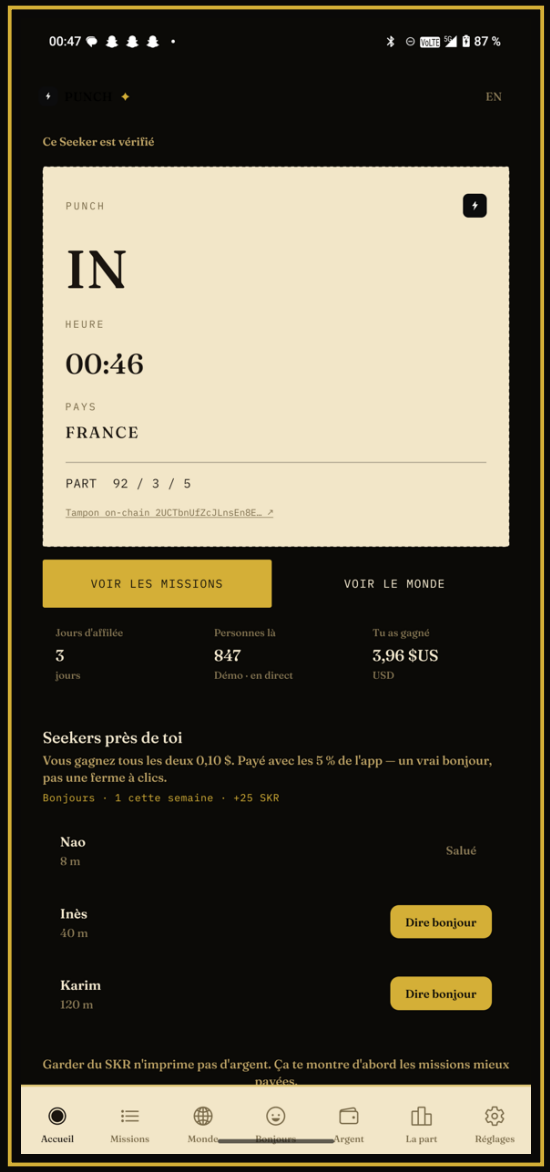

Re-compute any SHA-256 and match it against the public proof page —
CI keeps the chain honest: proof.html is generated, never hand-typed.
azumizeus.github.io/punch-clockin/proof.html

A release tag that doesn't match the code is refused before the APK is even built.

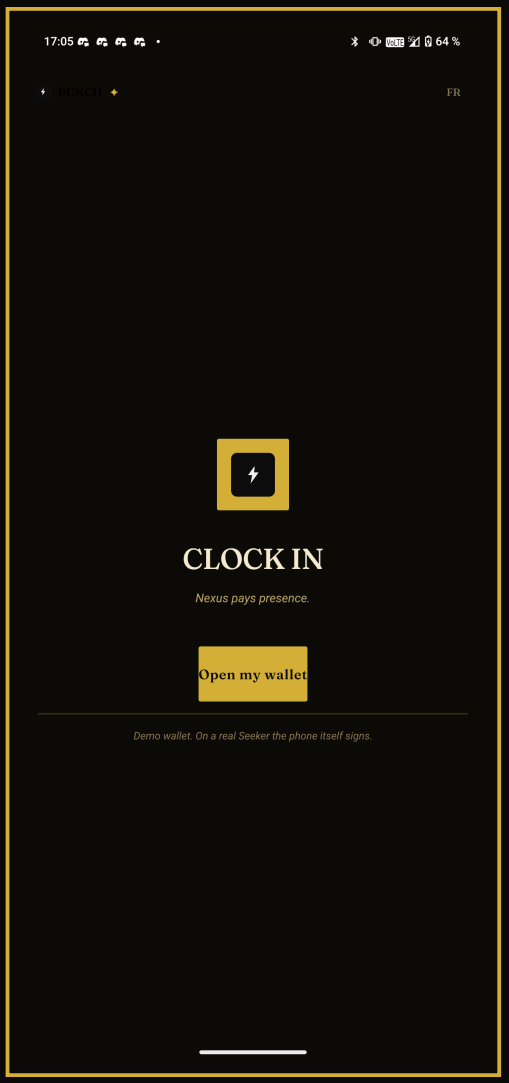

A punch clock you actually want to come back to

- A real drag-physics globe: every punch in the world drops a live dot.
- “Say hi” to a nearby Seeker pays you both $0.10 — a social gesture turned into a real micro-transaction.
- Seeker Premium identity: Gold / Nuit themes, ticket history with clickable signatures, interactive guided tour.
- 100% native (Expo / React Native) — signed APK, no Expo Go needed for judges.

A daily ritual for Seeker owners, an honest wage for communities

- Launch: Solana Mobile Seeker owners — Seed Vault built in, no seed phrases.
- Daily loop: punch in, take gigs, get paid — then come back tomorrow. Staking locks users in.
- Expansion: any Mobile Wallet Adapter device, then community attendance (events, coworking, crews).

Devnet today, mainnet when it deserves it

- Now (hackathon): full devnet economy, signed APK, verifiable receipts.
- Next: dedicated Anchor program for on-chain per-user staking (today's bookkeeping is app-side by design); treasury key moves server-side before any mainnet push.
- Later: geo-verified gigs, Seeker reputation beyond stake rank, mainnet.

Nexus Seeker — honest money for real presence

Thank you — Clock in. Build. Get paid. 92 / 3 / 5.
